NAVY EDITION

SECTION A · Warm-up

- A1** The force is attractive and proportional to the product of the masses (1); and inversely proportional to the square of their separation, $F = GMm/r^2$ (1). [2]
- A2** $F = GMm/r^2 = (6.67 \times 10^{-11} \times 5.0 \times 5.0)/2.0^2$ (1) [2]
 $F = 4.17 \times 10^{-10} \text{ N}$ (1)
- A3** Gravitational force per unit mass on a small test mass at the point (1); $g = F/m$ (1). [2]
- A4** 590 N: by Newton's third law the two forces are equal in magnitude (and opposite in direction) (1). The Earth's mass is enormous, so its acceleration $a = F/M$ is far too small to notice (1). [2]
- A5** g follows an inverse-square law, so trebling the distance from the centre divides g by $3^2 = 9$ (1) [2]
 $g = 9.8/9 = 1.1 \text{ N kg}^{-1}$ (1)
- A6** A mass whose size is negligible compared with the separation involved, so that it can be treated as being at a single point (1). A (uniform) sphere behaves, from outside, as if all its mass were concentrated at its centre, so the law applies with r measured from the centre (1). [2]

SECTION B · Standard

- B1** $F = GMm/r^2 = (6.67 \times 10^{-11} \times 6.0 \times 10^{24} \times 7.3 \times 10^{22})/(3.8 \times 10^8)^2$ (1) [2]
 $F = 2.02 \times 10^{20} \text{ N}$ (1)
- B2** $g = GM/r^2 = (6.67 \times 10^{-11} \times 6.0 \times 10^{24})/(6.4 \times 10^6)^2$ (1) [2]
 $g = 9.77 \text{ N kg}^{-1}$ (1)
- B3** $g = GM/r^2 = (6.67 \times 10^{-11} \times 6.0 \times 10^{24})/(1.28 \times 10^7)^2$ (1) [3]
 $g = 2.44 \text{ N kg}^{-1}$ (1)
 This is one quarter of the surface value: the distance has doubled, so g falls by a factor of 4 (inverse-square law) (1).
- B4** $g = GM/r^2 = (6.67 \times 10^{-11} \times 6.0 \times 10^{24})/(7.0 \times 10^6)^2 = 8.17 \text{ N kg}^{-1}$ (2) [3]
 $F = mg = 500 \times 8.17 = 4084 \text{ N} \approx 4.1 \times 10^3 \text{ N}$ (1)

B5 Conversions: $m = 0.074 \text{ kg}$, $r = 0.060 \text{ m}$ (1) [3]
 $F = Gm^2/r^2 = (6.67 \times 10^{-11} \times 0.074^2)/0.060^2 = 1.0 \times 10^{-10} \text{ N}$ (1)
 This is negligible compared with the other forces on a ball, such as its weight (about 0.7 N) or friction from the table (1).

B6 $F = GMm/r^2 = (6.67 \times 10^{-11} \times 2.0 \times 10^{30} \times 6.4 \times 10^{23})/(2.3 \times 10^{11})^2$ (1) [4]
 $F = 1.61 \times 10^{21} \text{ N}$ (1)
 $a = F/m = 1.61 \times 10^{21}/(6.4 \times 10^{23})$ (1)
 $a = 2.5 \times 10^{-3} \text{ m s}^{-2}$ (1)

B7 $r = \sqrt{GM/g}$ (1) [3]
 $r = \sqrt{(6.67 \times 10^{-11} \times 6.4 \times 10^{23})/1.0}$ (1)
 $r = 6.5 \times 10^6 \text{ m}$ (1)

SECTION C · Stretch

C1 $g = GM/r^2$ (1) [3]
 $g = (6.67 \times 10^{-11} \times 6.4 \times 10^{23})/(3.4 \times 10^6)^2$ (1)
 $g = 3.69 \text{ N kg}^{-1} \approx 3.7 \text{ N kg}^{-1}$ (1)

C2 $M = gr^2/G$ (1) [3]
 $M = (9.81 \times (6.4 \times 10^6)^2)/(6.67 \times 10^{-11})$ (1)
 $M = 6.02 \times 10^{24} \text{ kg}$ (1)

C3 The field lines spread out over a larger area as distance increases, so the field becomes weaker (1). From $g = GM/r^2$, g follows an inverse-square law with distance from the centre (1); for example, doubling r reduces g to one quarter of its value (1). [3]

C4 Use of $g = GM/r^2$ for each planet (1) [4]
 $g_K = (6.67 \times 10^{-11} \times 3.0 \times 10^{25})/(1.6 \times 10^7)^2 = 7.8 \text{ N kg}^{-1}$ (1)
 $g_L = (6.67 \times 10^{-11} \times 8.9 \times 10^{24})/(7.7 \times 10^6)^2 = 10.0 \text{ N kg}^{-1}$ (1)
 The claim is not correct: only L exceeds 9.8 N kg^{-1} ; K's larger mass is outweighed by its larger radius (1).

C5 Sensible estimate of the masses, for example 70 kg each (1) [3]
 $F = Gm_1m_2/r^2 = (6.67 \times 10^{-11} \times 70 \times 70)/1.0^2 \approx 3.3 \times 10^{-7} \text{ N}$ (1)
 This is of order 10^{-7} N against a weight of about 700 N: some nine orders of magnitude smaller, which is why we never notice the attraction (1).

- C6** $r = 6.4 \times 10^6 + 4.2 \times 10^5 = 6.82 \times 10^6$ m, measured from the planet's centre (1) [5]
 $g = GM/r^2 = (6.67 \times 10^{-11} \times 6.0 \times 10^{24}) / (6.82 \times 10^6)^2$ (1)
 $g = 8.60 \text{ N kg}^{-1} \approx 8.6 \text{ N kg}^{-1}$ (1)
The laboratory and the crew are both in free fall, accelerating towards the planet at the same rate (1); there is therefore no contact (support) force between the crew and the laboratory, so the crew appear weightless (1).
-
